Overview

If your microcontroller or microcomputer has digital audio capability, this amp is for you! It takes standard I2S digital audio input and, not only decodes it into analog, but also amplifies it directly into a speaker. Perfect for adding compact amplified sound, it takes 2 breakouts (I2S DAC + Amp) and combines them into one.

I2S (not to be confused with I2C) is a digital sound protocol that is used on circuit boards to pass audio data around. Many high end chips and processors manage all of the audio in digital I2S format. Then, to input or output data, three or four pins are used (data in, data out, bit clock and left-right channel select). Usually, for audio devices, there's a DAC chip that will take I2S in and convert it to analog that can drive a headphone.

This small mono amplifier is surprisingly powerful - able to deliver 3.2 Watts of power into a 4 ohm impedance speaker (5V power @ 10% THD). Inside the miniature chip is a class D controller, able to run from 2.7V-5.5VDC. Since the amp is a class D, it's incredibly efficient - making it perfect for portable and battery-powered projects. It has built in thermal and over-current protection but we could barely tell it got hot.

The audio input is I2S standard, you can use 3.3V or 5V logic data. The outputs are "Bridge Tied" - that means they connect directly to the outputs, no connection to ground. The output is a ~300KHz square wave PWM that is then 'averaged out' by the speaker coil - the high frequencies are not heard. All the above means that you can't connect the output into another amplifier, it should drive the speakers directly.

There's a Gain pin that can be manipulated to change the gain. By default, the amp will give you **9dB** of gain. By connecting a pullup or pull down resistor, or wiring directly, the Gain pin can be set up to give 3dB, 6dB, 9dB, 12dB or 15dB.

the ShutDown/Mode pin can be used to put the chip in shutdown or set up which I2S audio channel is piped to the speaker. By default, the amp will output (L+R)/2 stereo mix into mono out. By adding a resistor, you can change it to be just left or just right output

Works great with Raspberry Pi, Arduino Zero, and any other microcontroller or microcomputer with I2S audio outputs

Specs:

- Output Power: 3.2W at 4Ω, 10% THD, 1.8W at 8Ω, 10% THD, with 5V supply
- PSRR: 77 dB typ @ 1KHz
- I2S sample rates from 8kHz to 96kHz
- No MCLK required
- Click + Pop reduction
- Five pin-selectable gains: 3dB, 6dB, 9dB, 12dB, 15dB
- Excellent click-and-pop suppression
- Thermal shutdown protection

Comes as an assembled and tested breakout board, with a small piece of optional header and 3.5mm terminal block. Some soldering is required to attach the header and terminal block if those are desired.

Pinouts

The MAX98357A is an **I2S** amplifier - it does not use analog inputs, it only has digital audio input support! Don't confuse I2S with I2C, I2S is a sound protocol whereas I2C is for small amounts of data.

Speaker Output

This amplifier is designed to drive moving coil loudspeakers only. Speaker impedance must be 4Ω or more. The output signal is a 330KHz PWM square wave with a duty cycle proportional to the audio signal. The inductance of the speaker coil serves as a low-pass filter to average out the high-frequency components. Do not try to use this as a pre-amplifier.

The outputs of *each channel* are "Bridge-Tied" with no connection to ground. This means that for each channels, the + and - alternate polarity to create a single channel amplifier with twice the available power.

Connect your speakers using the 3.5mm screw-terminal blocks.

- 5V into 4Ω @ 10% THD - 3W max
- 5V into 4Ω @ 1% THD - 2.5W max
- 3.3V into 4Ω @ 10% THD - 1.3W max
- 3.3V into 4Ω @ 1% THD - 1.0W max
- 5V into 8Ω @ 10% THD - 1.8W max
- 5V into 8Ω @ 1% THD - 1.4W max
- 3.3V into 8Ω @ 10% THD - 0.8W max
- 3.3V into 8Ω @ 1% THD - 0.6W max

Power Pins

This is the power for the amplifier and logic of the amplifier. You can provide 2.5V up to 5.5V. Note that at 5V you can end up putting up to 2.8W into your speaker, so make sure your power supply can easily handle up to 650mA and we recommend a power supply spec'd for at least 800mA to give yourself some 'room'

If you have a 3.3V logic device, you can still power the amp from 5V, and that's recommended to get the most power output!

I2S Pins

Three pins are used to receive audio data. These can be 3.3-5V logic

- **LRC** (Left/Right Clock) - this is the pin that tells the amplifier when the data is for the left channel and when its for the right channel
- **BCLK** (Bit Clock) - This is the pin that tells the amplifier when to read data on the data pin.
- **DIN** (Data In) - This is the pin that has the actual data coming in, both left and right data are sent on this pin, the LRC pin indicates when left or right is being transmitted

Note that this amplifier does not require an **MCLK** pin, if you have an MCLK output, you can leave it disconnected!

Other Pins

The other settings are handled by **GAIN** and **SD**

Gain

GAIN is, well, the gain setting. You can have a gain of **3dB**, **6dB**, **9dB**, **12dB** or **15dB**.

- **15dB** if a 100K resistor is connected between **GAIN** and **GND**
- **12dB** if **GAIN** is connected directly to **GND**
- **9dB** if **GAIN** is not connected to anything (this is the default)
- **6dB** if **GAIN** is connected directly to **Vin**
- **3dB** if a 100K resistor is connected between **GAIN** and **Vin**

This way, the default gain is 9dB but you can easily change it by tweaking the connection to the **GAIN** pin. Note you may need to perform a power reset to adjust the gain.

SD / MODE

This pin is used for shutdown mode but is *also* used for setting which channel is output. It's a little confusing but essentially:

- If **SD** is connected to ground directly (voltage is under 0.16V) then the amp is **shut down**
- If the voltage on **SD** is between 0.16V and 0.77V then the output is (Left + Right)/2, that is the stereo average.
- If the voltage on **SD** is between 0.77V and 1.4V then the output is just the Right channel
- If the voltage on **SD** is higher than 1.4V then the output is the Left channel.

This is compounded by an *internal* 100K pulldown resistor on **SD** so you need to use a pullup resistor on SD to balance out the 100K internal pulldown.

For the breakout board, there's a 1Mohm resistor from **SD** to **Vin** which, when powering from 5V will give you the

'stereo average' output. If you want left or right channel only, or if you are powering from non-5V power, you may need to experiment with different resistors to get the desired voltage on **SD**

Assembly

Prepare the header strip:

Cut the strip to length if necessary. It will be easier to solder if you insert it into a breadboard - **long pins down**

Add the breakout board:

Place the breakout board over the pins so that the short pins poke through the breakout pads

And Solder!

Be sure to solder all pins for reliable electrical contact.

(For tips on soldering, be sure to check out our [Guide to Excellent Soldering](https://adafruit.it/aTk) (<https://adafruit.it/aTk>)).

You're done! Check your solder joints visually and continue onto the next steps

If you want to use a terminal block for connecting a speaker, place the 3.5mm terminal so the mouths point out.

Solder in both pins with plenty of solder!

Raspberry Pi Wiring

if you have a Raspberry Pi and you want higher quality audio than the headphone jack can provide, I2S is a good option! You only use 3 pins, and since its a pure-digital output, there can be less noise and interference. Of course, you'll need to make sure that you have a nice strong 5V power supply so make sure to add 500mA or more to your power supply requirements!

This board also works very well with boards that *don't* have audio like the Pi Zero

This technique will work with any Raspberry Pi with the 2x20 connector. Older Pi 1's with a 2x13 connector do not bring out the I2S pins as easily

Connect:

- Amp Vin to Raspberry Pi 5V
- Amp GND to Raspberry Pi GND
- Amp DIN to Raspberry Pi #21
- Amp BCLK to Raspberry Pi #18
- Amp LRCLK to Raspberry Pi #19

Raspberry Pi Setup

At this time, Jessie Raspberry Pi kernel does not support mono audio out of the I2S interface, you can only play stereo, so any mono audio files may need conversion to stereo!

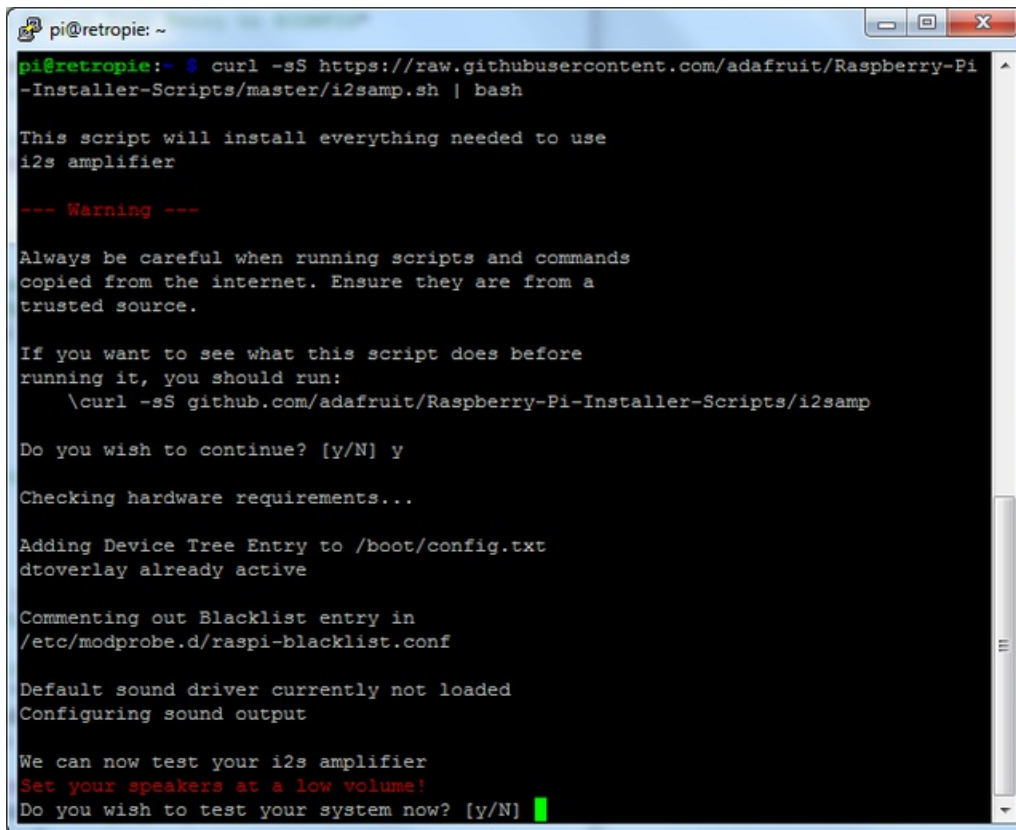

Fast Install

Luckily its quite easy to install support for I2S DACs on Raspbian Jessie.

These instructions are totally cribbed from the [PhatDAC instructions](#) at the lovely folks at Pimoroni!

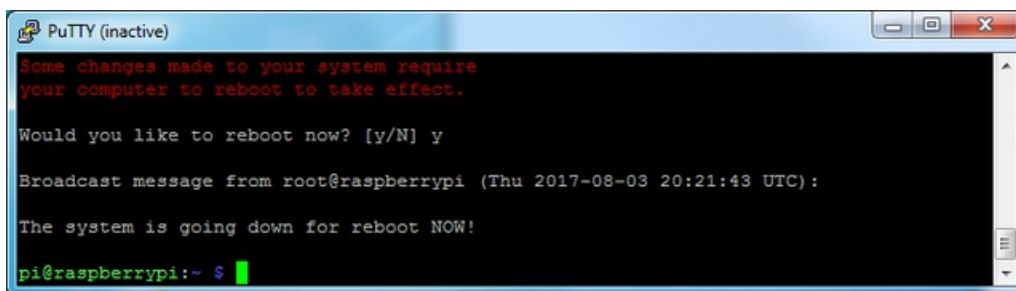

Run the following from your Raspberry Pi with Internet connectivity:

```
curl -sS https://raw.githubusercontent.com/adafruit/Raspberry-Pi-Installer-Scripts/master/i2samp.sh | bash
```

```
pi@retropie: ~  
pi@retropie:~$ curl -sS https://raw.githubusercontent.com/adafruit/Raspberry-Pi-Installer-Scripts/master/i2samp.sh | bash  
  
This script will install everything needed to use  
i2s amplifier  
  
--- Warning ---  
  
Always be careful when running scripts and commands  
copied from the internet. Ensure they are from a  
trusted source.  
  
If you want to see what this script does before  
running it, you should run:  
  \curl -sS github.com/adafruit/Raspberry-Pi-Installer-Scripts/i2samp  
  
Do you wish to continue? [y/N] y

/etc/modprobe.d/raspi-blacklist.conf  
  
Default sound driver currently not loaded  
Configuring sound output  
  
We can now test your i2s amplifier  
Set your speakers at a low volume!  
Do you wish to test your system now? [y/N]
```

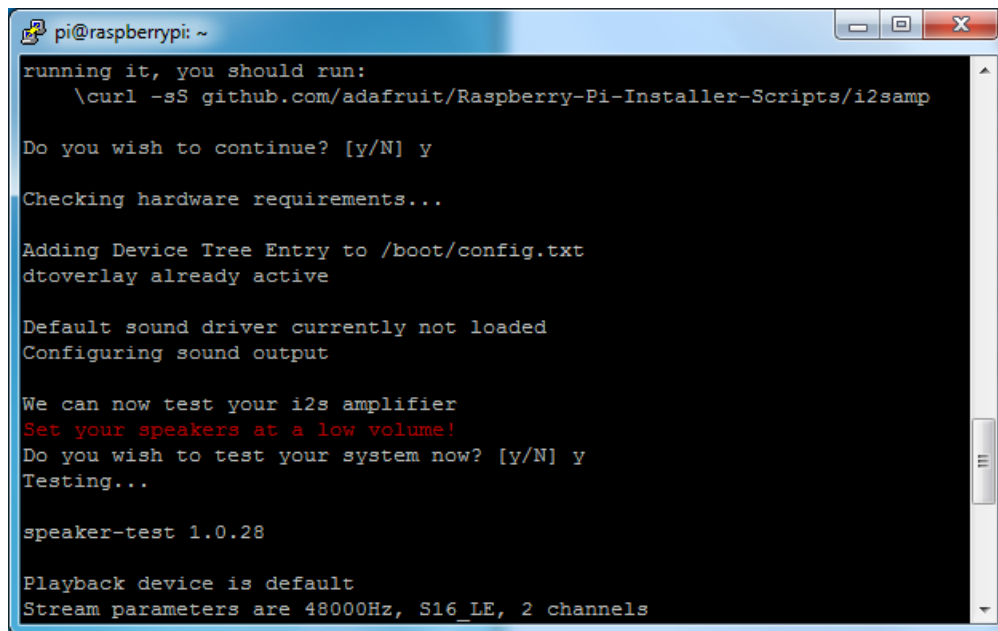

You will need to reboot once installed.

```
PuTTY (inactive)  
  
Some changes made to your system require  
your computer to reboot to take effect.  
  
Would you like to reboot now? [y/N] y  
  
Broadcast message from root@raspberrypi (Thu 2017-08-03 20:21:43 UTC):  
  
The system is going down for reboot NOW!  
  
pi@raspberrypi:~$
```

You must reboot to enable the speaker hardware!

After rebooting, log back in and re-run the script again...It will ask you if you want to test the speaker. Say **yes** and listen for audio to come out of your speakers...

```
pi@raspberrypi: ~  
running it, you should run:  
  \curl -sS github.com/adafruit/Raspberry-Pi-Installer-Scripts/i2samp  
  
Do you wish to continue? [y/N] y  
  
Checking hardware requirements...  
  
Adding Device Tree Entry to /boot/config.txt  
dtoverlay already active  
  
Default sound driver currently not loaded  
Configuring sound output  
  
We can now test your i2s amplifier  
Set your speakers at a low volume!  
Do you wish to test your system now? [y/N] y  
Testing...  
  
speaker-test 1.0.28  
  
Playback device is default  
Stream parameters are 48000Hz, S16_LE, 2 channels
```

In order to have volume control appear in Raspbian desktop or RetroPie you must reboot a second time after doing the speaker test, with **sudo reboot**

You can then go to the next page on testing and optimizing your setup. Skip the rest of this page on **Detailed Installation** if the script worked for you!

Detailed Install

If, for some reason, you can't just run the script and you want to go through the install by hand - here's all the steps!

Update /etc/modprobe.d (if it exists)

Log into your Pi and get into a serial console (either via a console cable, the TV console, RXVT, or what have you)

Edit the raspi blacklist with

```
sudo nano /etc/modprobe.d/raspi-blacklist.conf
```

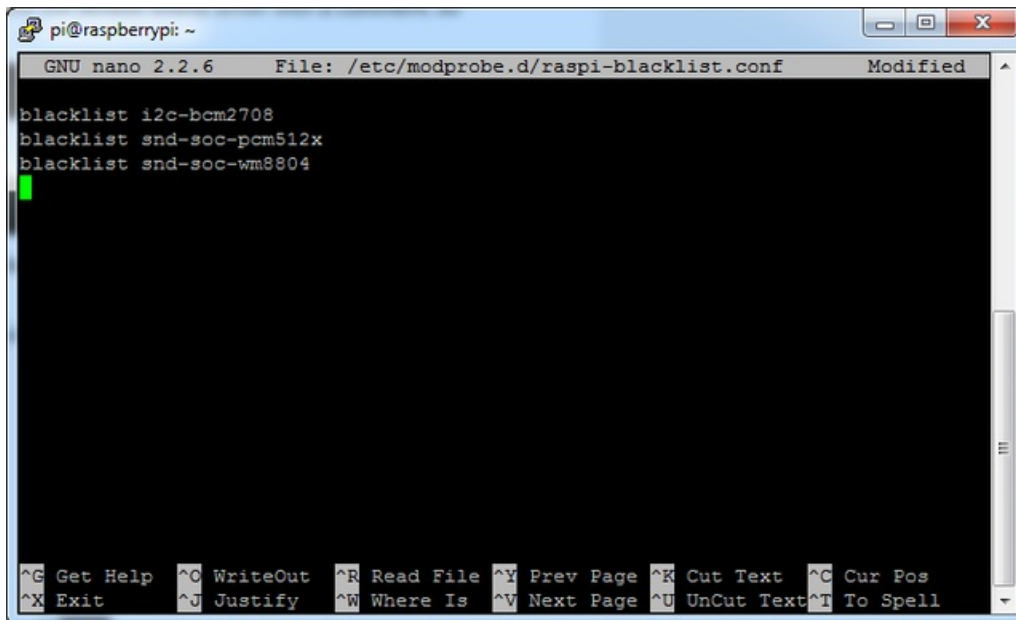

```
pi@raspberrypi: ~  
pi@raspberrypi:~ $ sudo nano /etc/modprobe.d/raspi-blacklist.conf
```

If the file is empty, just skip this step

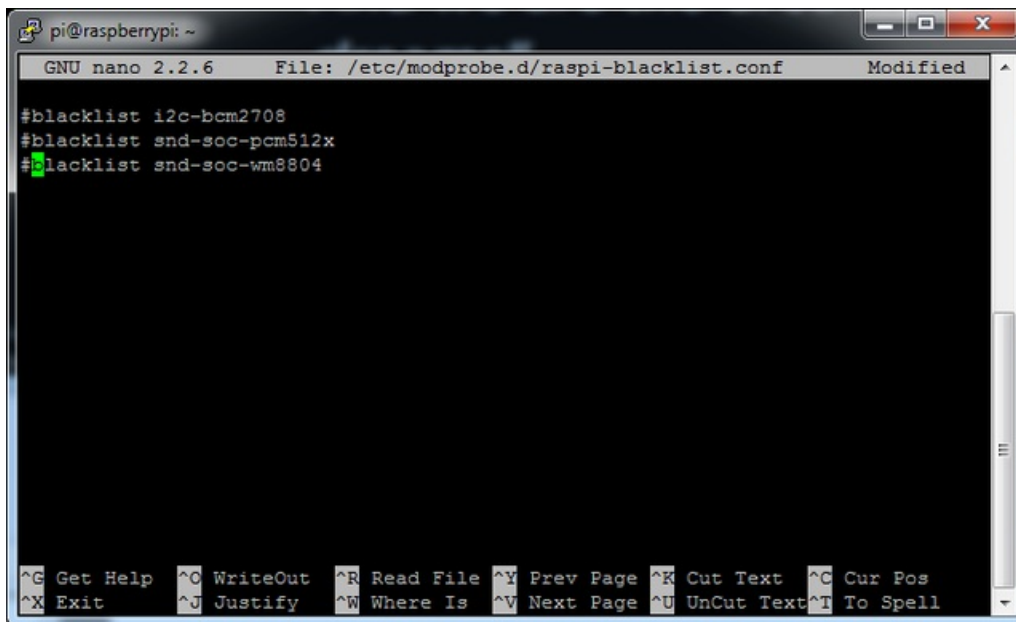

However, if you see the following lines:

```
blacklist i2c-bcm2708
blacklist snd-soc-pcm512x
blacklist snd-soc-wm8804
```

```
pi@raspberrypi: ~
GNU nano 2.2.6 File: /etc/modprobe.d/raspi-blacklist.conf Modified
blacklist i2c-bcm2708
blacklist snd-soc-pcm512x
blacklist snd-soc-wm8804
^G Get Help ^O WriteOut ^R Read File ^Y Prev Page ^K Cut Text ^C Cur Pos
^X Exit ^J Justify ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

Update the lines by putting a # before each line

```
pi@raspberrypi: ~
GNU nano 2.2.6 File: /etc/modprobe.d/raspi-blacklist.conf Modified
#blacklist i2c-bcm2708
#blacklist snd-soc-pcm512x
#blacklist snd-soc-wm8804
^G Get Help ^O WriteOut ^R Read File ^Y Prev Page ^K Cut Text ^C Cur Pos
^X Exit ^J Justify ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

Save by typing **Control-X Y <return>**

Disable headphone audio (if it's set)

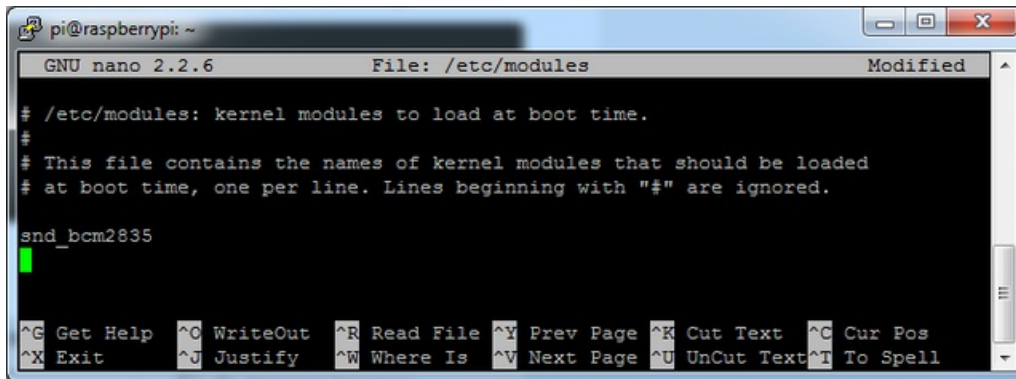

Edit the raspi modules list with

```
sudo nano /etc/modules
```

If the file is empty, just skip this step

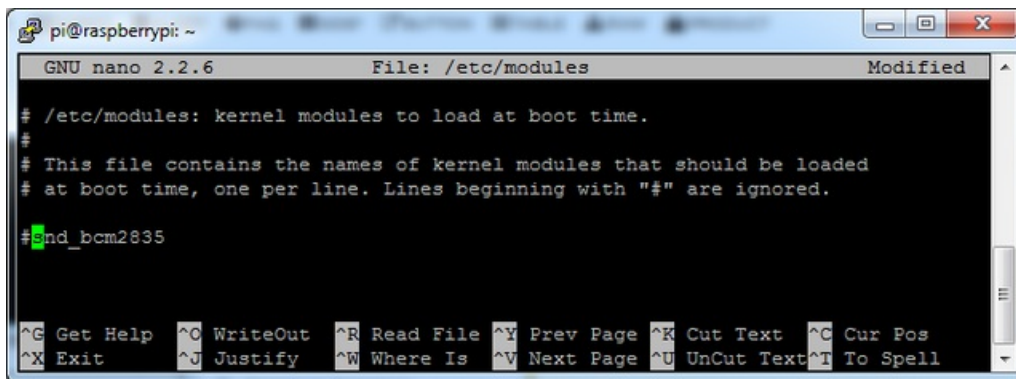

However, if you see the following line:

```
snd_bcm2835
```

```
pi@raspberrypi: ~  
GNU nano 2.2.6 File: /etc/modules Modified  
# /etc/modules: kernel modules to load at boot time.  
#  
# This file contains the names of kernel modules that should be loaded  
# at boot time, one per line. Lines beginning with "#" are ignored.  
  
snd_bcm2835  
  
^G Get Help ^O WriteOut ^R Read File ^Y Prev Page ^K Cut Text ^C Cur Pos  
^X Exit ^J Justify ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

Put a # in front of it

```
pi@raspberrypi: ~  
GNU nano 2.2.6 File: /etc/modules Modified  
# /etc/modules: kernel modules to load at boot time.  
#  
# This file contains the names of kernel modules that should be loaded  
# at boot time, one per line. Lines beginning with "#" are ignored.  
  
#snd_bcm2835  
  
^G Get Help ^O WriteOut ^R Read File ^Y Prev Page ^K Cut Text ^C Cur Pos  
^X Exit ^J Justify ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

and save with **Control-X Y <return>**

Create asound.conf file

Edit the raspi modules list with

```
sudo nano /etc/asound.conf
```

This file ought to be blank!

Copy and paste the following text into the file

```
pcm.speakerbonnet {
    type hw card 0
}

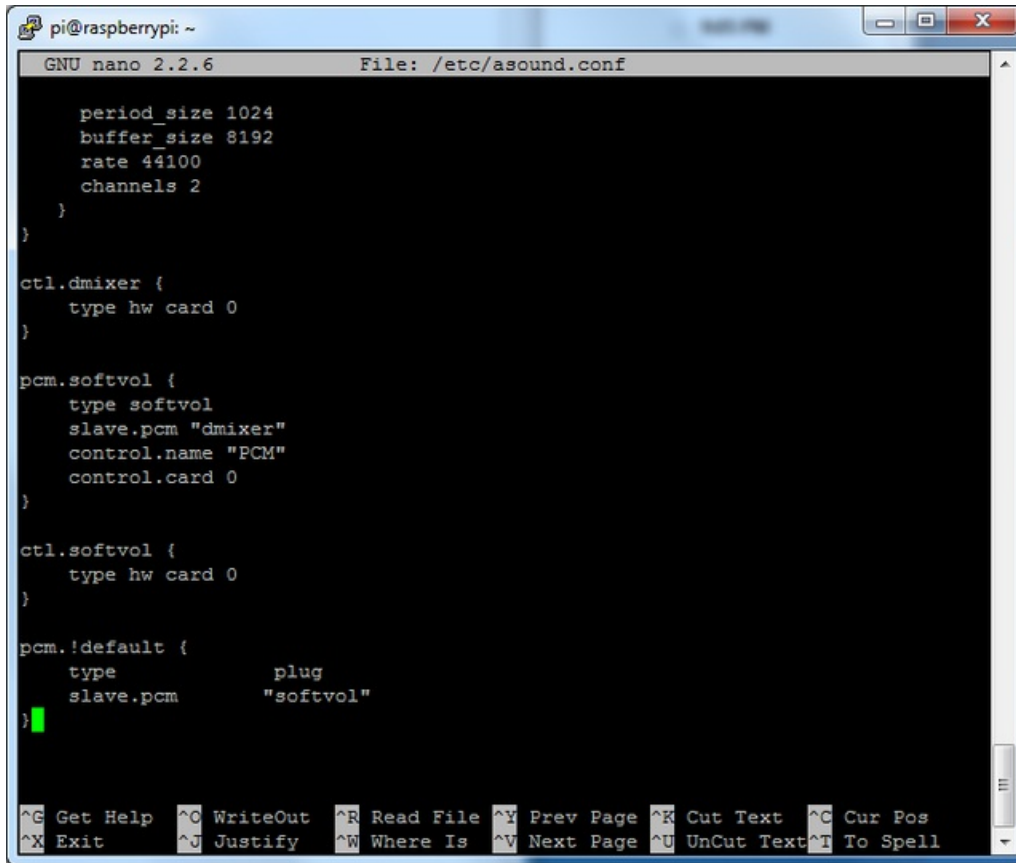

pcm.dmixer {
    type dmix
    ipc_key 1024
    ipc_perm 0666
    slave {
        pcm "speakerbonnet"
        period_time 0
        period_size 1024
        buffer_size 8192
        rate 44100
        channels 2
    }
}

ctl.dmixer {
    type hw card 0
}

pcm.softvol {
    type softvol
    slave.pcm "dmixer"
    control.name "PCM"
    control.card 0
}

ctl.softvol {
    type hw card 0
}

pcm.!default {
    type                plug
    slave.pcm            "softvol"
}
```

```
pi@raspberrypi: ~
GNU nano 2.2.6 File: /etc/asound.conf

    period_size 1024
    buffer_size 8192
    rate 44100
    channels 2
}

ctl.dmixer {
    type hw card 0
}

pcm.softvol {
    type softvol
    slave.pcm "dmixer"
    control.name "PCM"
    control.card 0
}

ctl.softvol {
    type hw card 0
}

pcm.!default {
    type            plug
    slave.pcm        "softvol"
}

^G Get Help  ^O WriteOut  ^R Read File ^Y Prev Page ^K Cut Text  ^C Cur Pos
^X Exit      ^J Justify   ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

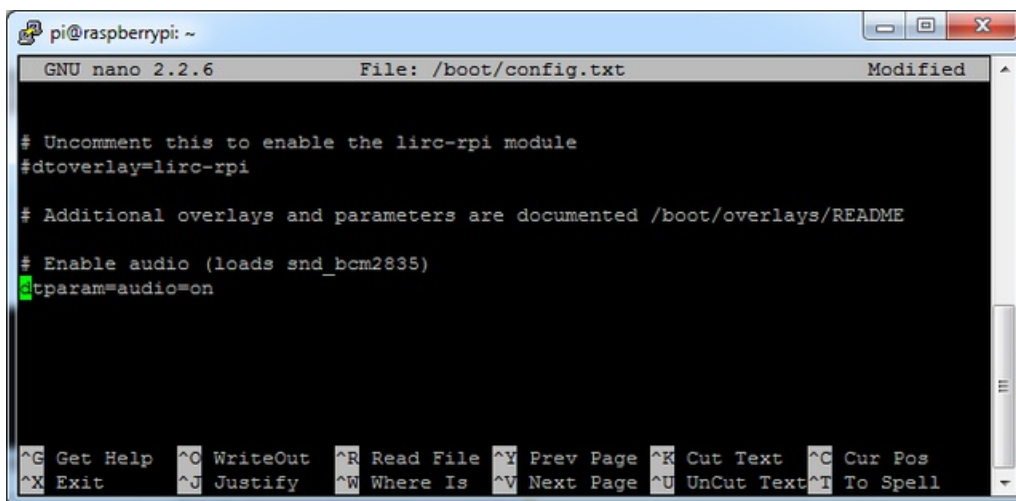

Save the file as usual

Add Device Tree Overlay

Edit your Pi configuration file with

```
sudo nano /boot/config.txt
```

And scroll down to the bottom. If you see a line that says: `dtoverlay=audio=on`

```
pi@raspberrypi: ~
GNU nano 2.2.6 File: /boot/config.txt Modified

# Uncomment this to enable the lirc-rpi module
#dtoverlay=lirc-rpi

# Additional overlays and parameters are documented /boot/overlays/README

# Enable audio (loads snd_bcm2835)
dtoverlay=audio=on

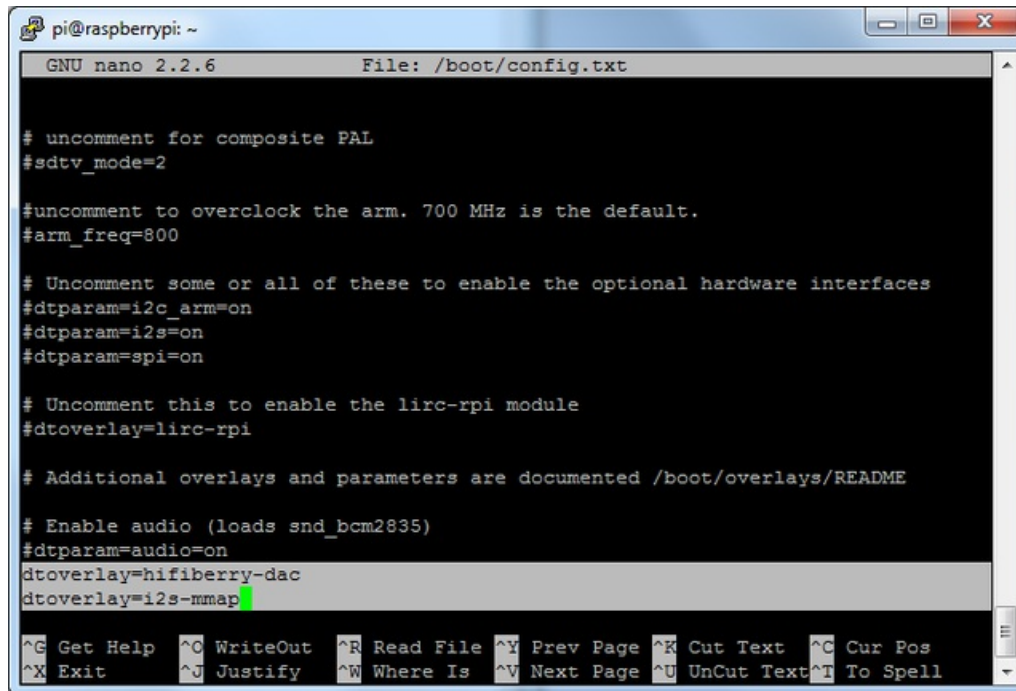

^G Get Help  ^O WriteOut  ^R Read File ^Y Prev Page ^K Cut Text  ^C Cur Pos
^X Exit      ^J Justify   ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

Disable it by putting a # in front.

Then add:

```
dtoverlay=hifiberry-dac  
dtoverlay=i2s-mmap
```

on the next line. Save the file.

```
pi@raspberrypi: ~  
GNU nano 2.2.6 File: /boot/config.txt  
  
# uncomment for composite PAL  
#sdtv_mode=2  
  
#uncomment to overclock the arm. 700 MHz is the default.  
#arm_freq=800  
  
# Uncomment some or all of these to enable the optional hardware interfaces  
#dtparam=i2c_arm=on  
#dtparam=i2s=on  
#dtparam=spi=on  
  
# Uncomment this to enable the lirc-rpi module  
#dtoverlay=lirc-rpi  
  
# Additional overlays and parameters are documented /boot/overlays/README  
  
# Enable audio (loads snd_bcm2835)  
#dtparam=audio=on  
dtoverlay=hifiberry-dac  
dtoverlay=i2s-mmap  
  
^G Get Help ^O WriteOut ^R Read File ^Y Prev Page ^K Cut Text ^C Cur Pos  
^X Exit ^J Justify ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

Reboot your Pi with `sudo reboot`

Raspberry Pi Test Speaker Tests!

OK you can use whatever software you like to play audio but if you'd like to test the speaker output, here's some quick commands that will let you verify your amp and speaker are working as they should!

Simple white noise speaker test

Run `speaker-test -c2` to generate white noise out of the speaker, alternating left and right. Since the I2S amp merges left and right channels, you'll hear continuous white noise

Simple WAV speaker test

Once you've got something coming out, try to play an audio file with `speaker-test` (for WAV files, not MP3)

```
speaker-test -c2 --test=wav -w /usr/share/sounds/alsa/Front_Center.wav
```

You'll hear audio coming from left and right alternating speakers

Simple MP3 speaker test

If you want to play a stream of music, you can try

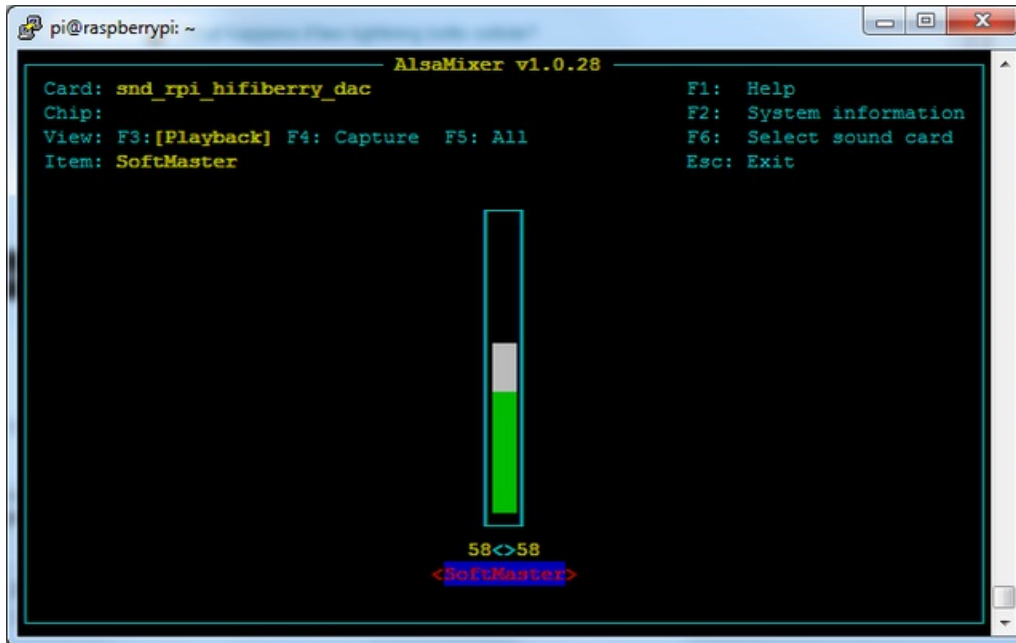

```
sudo apt-get install -y mpg123  
mpg123 http://ice1.somafm.com/u80s-128-mp3
```

If you want to play MP3's on command, check out [this tutorial](#) which covers how to set that up

At this time, Jessie Raspberry Pi kernel **does not support mono audio** out of the I2S interface, **you can only play stereo**, so any mono audio files may need conversion to stereo!

Volume adjustment

Many programs like PyGame and Sonic Pi have volume control within the application. For other programs you can set the volume using the command line tool called `alsamixer`. Just type `alsamixer` in and then use the up/down arrows to set the volume. Press Escape once its set

In Raspbian PIXEL you can set the volume using the menu item control. If it has an X through it, try restarting the Pi (you have to restart twice after install to get PIXEL to recognize the volume control)

Pi I2S Tweaks

This page is deprecated, our installer already performs these steps for you, but we'll keep them here for archival use!

Reducing popping

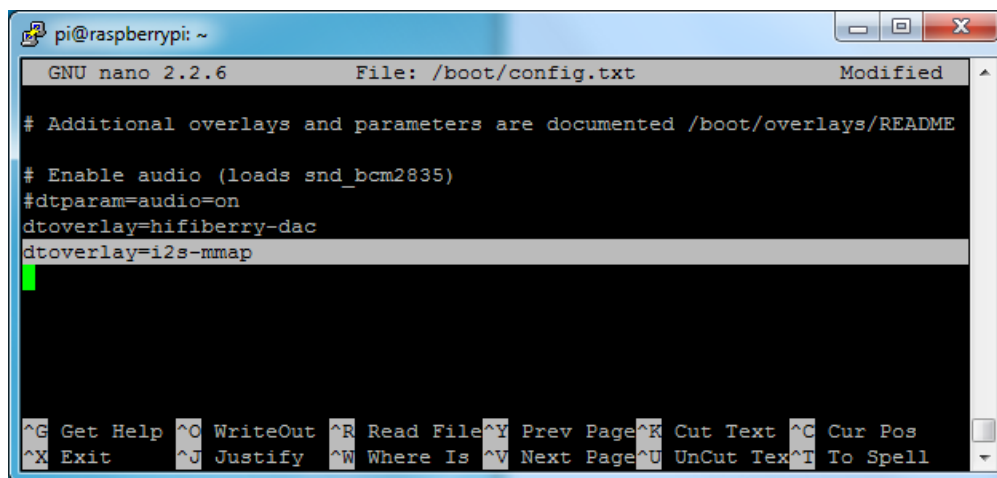

For people who followed our original installation instructions with the simple alsa config, they may find that the I2S audio pops when playing new audio.

The workaround is to use a software mixer to output a fixed sample rate to the I2S device so the bit clock does not change. I use ALSA so I configured **dmixer** and I no longer have any pops or clicks. Note that the RaspPi I2S driver does not support **dmixer** by default and you must [follow these instructions provided](#) to add it. Continue on for step-by-step on how to enable it!

Step 1

Start by modify `/boot/config.txt` to add `dtoverlay=i2s-mmap`

Run `sudo nano /boot/config.txt` and add the text to the bottom like so:

```
pi@raspberrypi: ~  
GNU nano 2.2.6 File: /boot/config.txt Modified  
# Additional overlays and parameters are documented /boot/overlays/README  
# Enable audio (loads snd_bcm2835)  
#dtparam=audio=on  
dtoverlay=hifiberry-dac  
dtoverlay=i2s-mmap  
^G Get Help ^O WriteOut ^R Read File ^Y Prev Page ^K Cut Text ^C Cur Pos  
^X Exit ^J Justify ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

Save and exit.

Then change `/etc/asound.conf` to:

```

pcm.speakerbonnet {
    type hw card 0
}

pcm.!default {
    type plug
    slave.pcm "dmixer"
}

pcm.dmixer {
    type dmix
    ipc_key 1024
    ipc_perm 0666
    slave {
        pcm "speakerbonnet"
        period_time 0
        period_size 1024
        buffer_size 8192
        rate 44100
        channels 2
    }
}

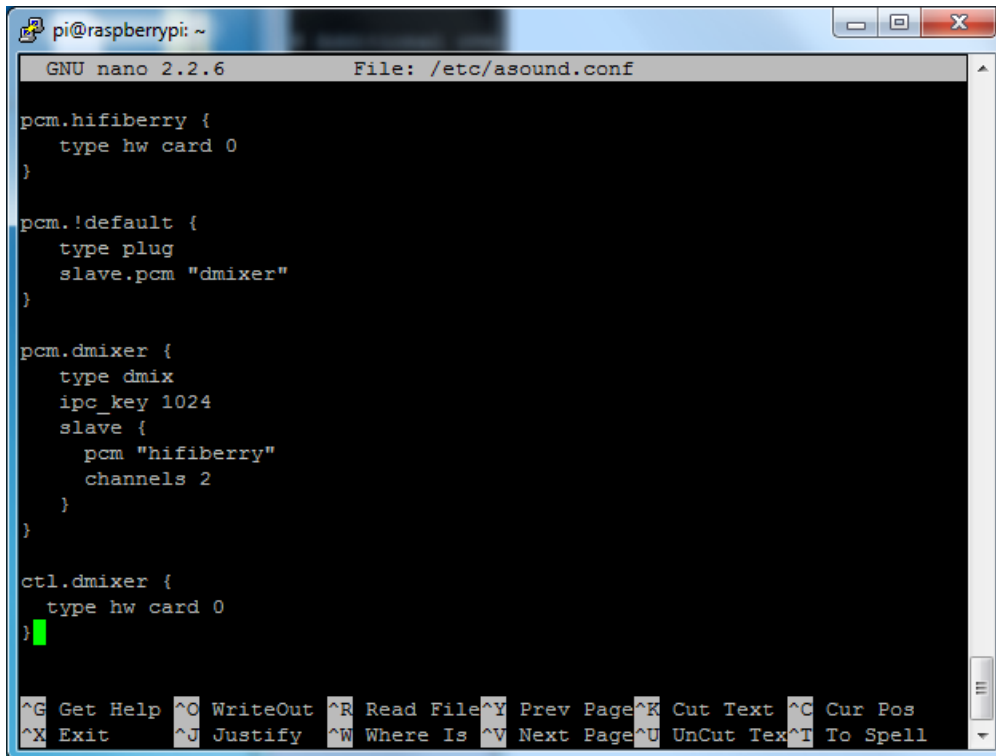

ctl.dmixer {
    type hw card 0
}

```

By running `sudo nano /etc/asound.conf`

This creates a PCM device called speakerbonnet which is connected to the hardware I2S device. Then we make a new 'dmix' device (`type dmix`) called `pcm.dmixer` . We give it a unique Inter Process Communication key (`ipc_key 1024`) and permissions that are world-read-writeable (`ipc_perm 0666`) The mixer will control the hardware pcm device speakerbonnet (pcm "speakerbonnet") and has a buffer set up so its nice and fast. The communication buffer is set up so there's no delays (`period_time 0` , `period_size 1024` and `buffer_size 8192` work well). The default mixed rate is 44.1khz stereo (`rate 44100 channels 2`)

Finally we set up a control interface but it ended up working best to just put in the hardware device here - `ctl.dmixer { type hw card 0 }`

```
pi@raspberrypi: ~
GNU nano 2.2.6 File: /etc/asound.conf

pcm.hifiberry {
    type hw card 0
}

pcm.!default {
    type plug
    slave.pcm "dmixer"
}

pcm.dmixer {
    type dmix
    ipc_key 1024
    slave {
        pcm "hifiberry"
        channels 2
    }
}

ctl.dmixer {
    type hw card 0
}
```

Save and exit. Then reboot the Pi to enable the mixer. Also, while it will *greatly* reduce popping, you still may get one once in a while - especially when first playing audio!

Add software volume control

The basic I2S chipset used here does not have software control built in. So we have to 'trick' the Pi into creating a software volume control. [Luckily, its not hard once you know how to do it.](#)

Create a new audio config file in `~/asoundrc` with `nano ~/.asoundrc` and inside put the following text:

```

pcm.speakerbonnet {
    type hw card 0
}

pcm.dmixer {
    type dmix
    ipc_key 1024
    ipc_perm 0666
    slave {
        pcm "speakerbonnet"
        period_time 0
        period_size 1024
        buffer_size 8192
        rate 44100
        channels 2
    }
}

ctl.dmixer {
    type hw card 0
}

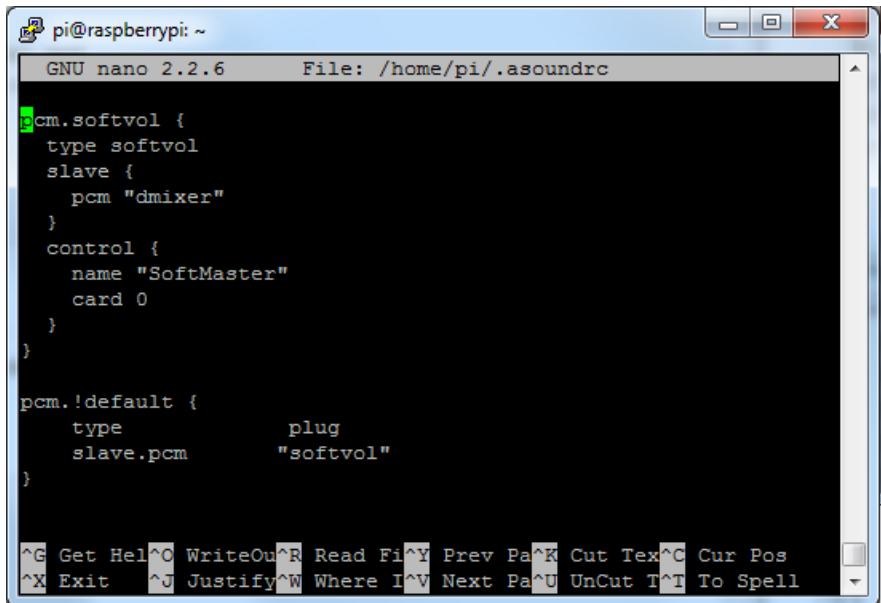

pcm.softvol {
    type softvol
    slave.pcm "dmixer"
    control.name "PCM"
    control.card 0
}

ctl.softvol {
    type hw card 0
}

pcm.!default {
    type          plug
    slave.pcm     "softvol"
}

```

This assumes you set up the dmixer for no-popping above!

```
pi@raspberrypi: ~
GNU nano 2.2.6 File: /home/pi/.asoundrc

pcm.softvol {
  type softvol
  slave {
    pcm "dmixer"
  }
  control {
    name "SoftMaster"
    card 0
  }
}

pcm.!default {
  type          plug
  slave.pcm     "softvol"
}

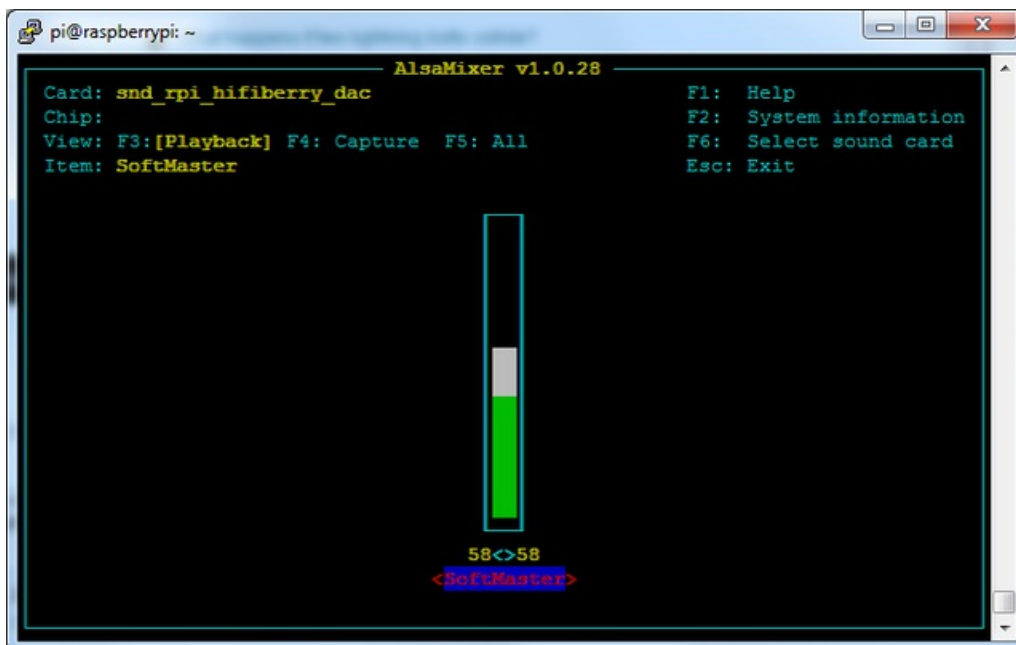

^G Get Hel^O WriteOu^R Read Fi^Y Prev Pa^K Cut Tex^C Cur Pos
^X Exit   ^J Justify^W Where I^V Next Pa^U UnCut T^T To Spell
```

Save and exit

Now, here's the trick, you have to reboot, then play some audio through alsa, then reboot to get the alsamixer to sync up right:

```
speaker-test -c2 --test=wav -w /usr/share/sounds/alsa/Front_Center.wav
```

Then you can type `alsamixer` to control the volume with the 'classic' alsa mixing interface

```
pi@raspberrypi: ~
AlsaMixer v1.0.28

Card: snd_rpi_hifiberry_dac
Chip:
View: F3:[Playback] F4: Capture F5: All
Item: SoftMaster

F1: Help
F2: System information
F6: Select sound card
Esc: Exit

58<->58
<SoftMaster>
```

Just press the up and down arrows to set the volume, and ESC to quit

Play Audio with PyGame

You can use **mpg123** for basic testing but it's a little clumsy for use where you want to dynamically change the volume or have an interactive program. For more powerful audio playback we suggest using PyGame to playback a variety of audio formats (MP3 included!)

Install PyGame

Start by installing pygame support, you'll need to open up a console on your Pi with network access and run:

```
sudo apt-get install python-pygame
```

Next, download this pygame example zip to your Pi

Click to download PyGame example code &
sample mp3s

<https://adafru.it/wbp>

On the command line, run

```
wget https://cdn-learn.adafruit.com/assets/assets/000/041/506/original/pygame_example.zip
```

```
unzip pygame_example.zip
```

Run Demo

Inside the zip is an example called **pygameMP3.py**

This example will playback all MP3's within the script's folder. To demonstrate that you can also adjust the volume within pygame, the second argument is the volume for playback. Specify a volume to playback with a command line argument between 0.0 and 1.0

For example here is how to play at 75% volume:

```
python pygameMP3.py 0.75
```

Here's the code if you have your own mp3s!

```
''' pg_midi_sound101.py
play midi music files (also mp3 files) using pygame
tested with Python273/331 and pygame192 by vegaseat
'''

#code modified by James DeVito from here: https://www.daniweb.com/programming/software-development/code/4

#!/usr/bin/python

import sys
import pygame as pg
import os
import time
```

```

def play_music(music_file):
    """
    stream music with mixer.music module in blocking manner
    this will stream the sound from disk while playing
    """
    clock = pg.time.Clock()
    try:
        pg.mixer.music.load(music_file)
        print("Music file {} loaded!".format(music_file))
    except pygame.error:
        print("File {} not found! {}".format(music_file, pg.get_error()))
        return

    pg.mixer.music.play()

    # If you want to fade in the audio...
    # for x in range(0,100):
    #     pg.mixer.music.set_volume(float(x)/100.0)
    #     time.sleep(.0075)
    # # check if playback has finished
    while pg.mixer.music.get_busy():
        clock.tick(30)

freq = 44100    # audio CD quality
bitsize = -16  # unsigned 16 bit
channels = 2    # 1 is mono, 2 is stereo
buffer = 2048   # number of samples (experiment to get right sound)
pg.mixer.init(freq, bitsize, channels, buffer)

if len(sys.argv) > 1:

    try:
        user_volume = float(sys.argv[1])
    except ValueError:
        print "Volume argument invalid. Please use a float (0.0 - 1.0)"
        pg.mixer.music.fadeout(1000)
        pg.mixer.music.stop()
        raise SystemExit

    print("Playing at volume: " + str(user_volume)+ "\n")
    pg.mixer.music.set_volume(user_volume)
    mp3s = []
    for file in os.listdir("."):
        if file.endswith(".mp3"):
            mp3s.append(file)

    print mp3s

    for x in mp3s:
        try:
            play_music(x)
            time.sleep(.25)
        except KeyboardInterrupt:
            # if user hits Ctrl/C then exit
            # (works only in console mode)
            pg.mixer.music.fadeout(1000)
            pg.mixer.music.stop()

```

```
    py.mixer.music.stop()
    raise SystemExit
else:
    print("Please specify volume as a float! (0.0 - 1.0)")
```

I2S Audio FAQ

Hey in Raspbian Pixel desktop, the speaker icon is X'd out!

Try rebooting once after playing some audio. Also make sure you have our latest alsa configuration (check the detailed install page on the Raspberry Pi Setup page for the [/etc/asound.conf](#) !

If its still not working, you can still change the volume, just use **alsamixer** from a Terminal command prompt.

Even with dmixer enabled, I get a staticy-pop when the Pi first boots or when it first starts playing audio

Yep, this is a known Raspbian Linux thing. Yay Linux! We don't have a fix for it. If it makes you feel better, my fancy Windows development computer does the same thing with my desktop speakers.

Does this work with my favorite software?

It will work with *anything* that has alsa audio support. There's thousands of linux programs so we can't guarantee all of them will work but here's what we found does for sure!

- **PyGame** - see our page on [playing audio with PyGame](#) for example code. Volume can be controlled within pygame
- **mpg123** - command line mp3 audio playback. use alsamixer to control the volume
- **aplay** - for playing wav files on the command line
- **Sonic Pi** - tested in the Pixel Desktop. Use the Sonic Pi settings panel to change the volume - it does not seem to care about what global audio volume you set!
- **Scratch 2** - tested in the Pixel Desktop. Works fine but may have a delay and make a popping sound the first time you play audio. You can set volume with alsamixer and also via the app by using the **set volume to nn%** block
- **Scratch 1** - doesn't work, something not set up with Scratch 1 to use alsa?
- **RetroPie/Emulation Station** - audio works within games (we tested NES and MAME libretro) but does not work in the 'main screen' (selecting which game to play interface)
